

Mega Journals

And what they mean for the future of scientific publishing

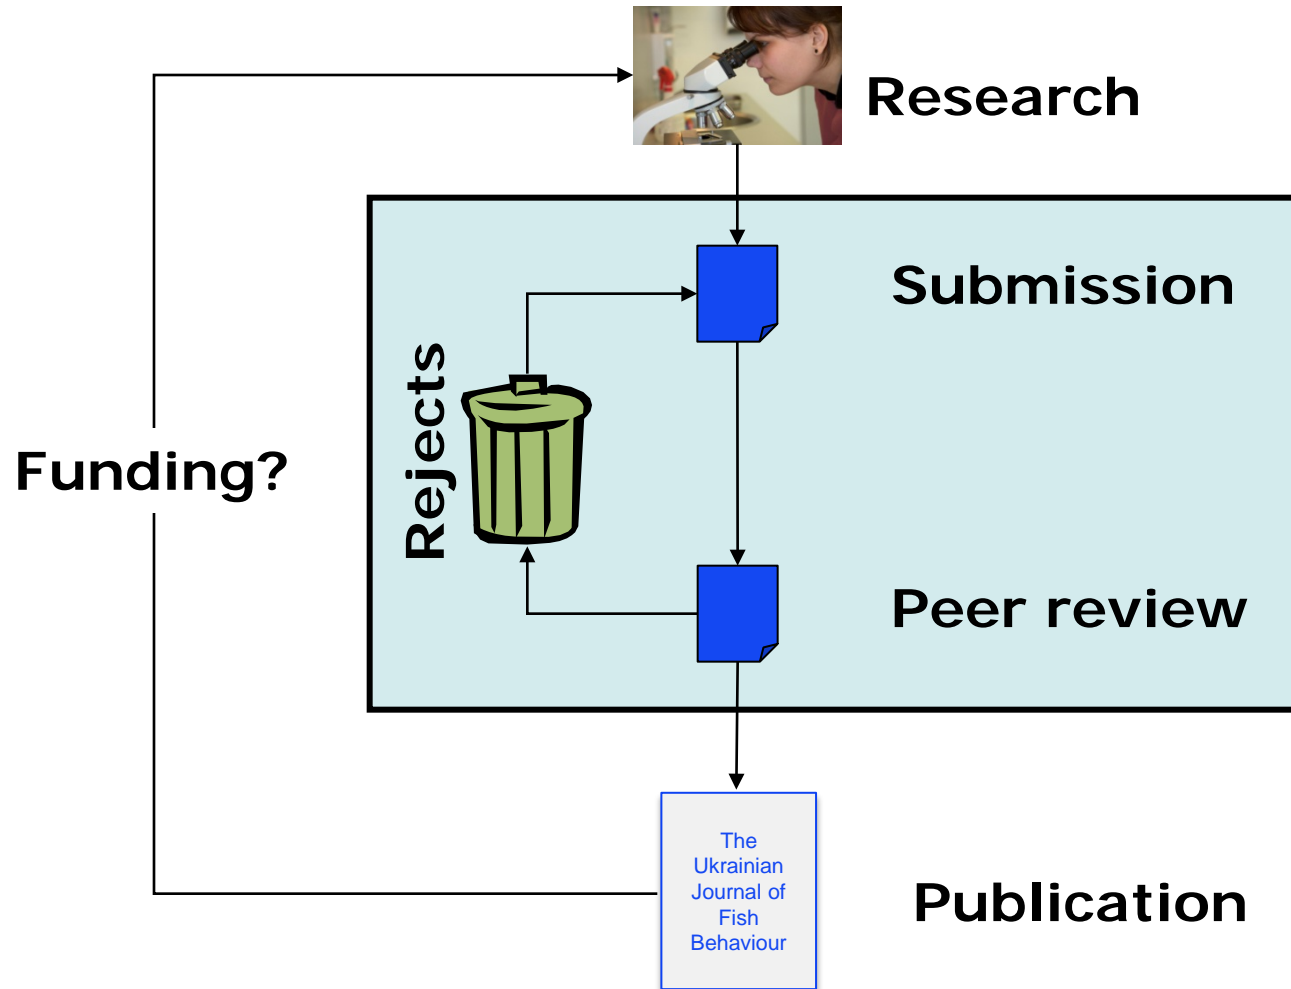

Damian Pattinson, PhD
Editorial Director, PLOS ONE

Nov 22, 2012

What's the problem with the current system?

What's the problem with the current system?

Is the communication trail fit for purpose?

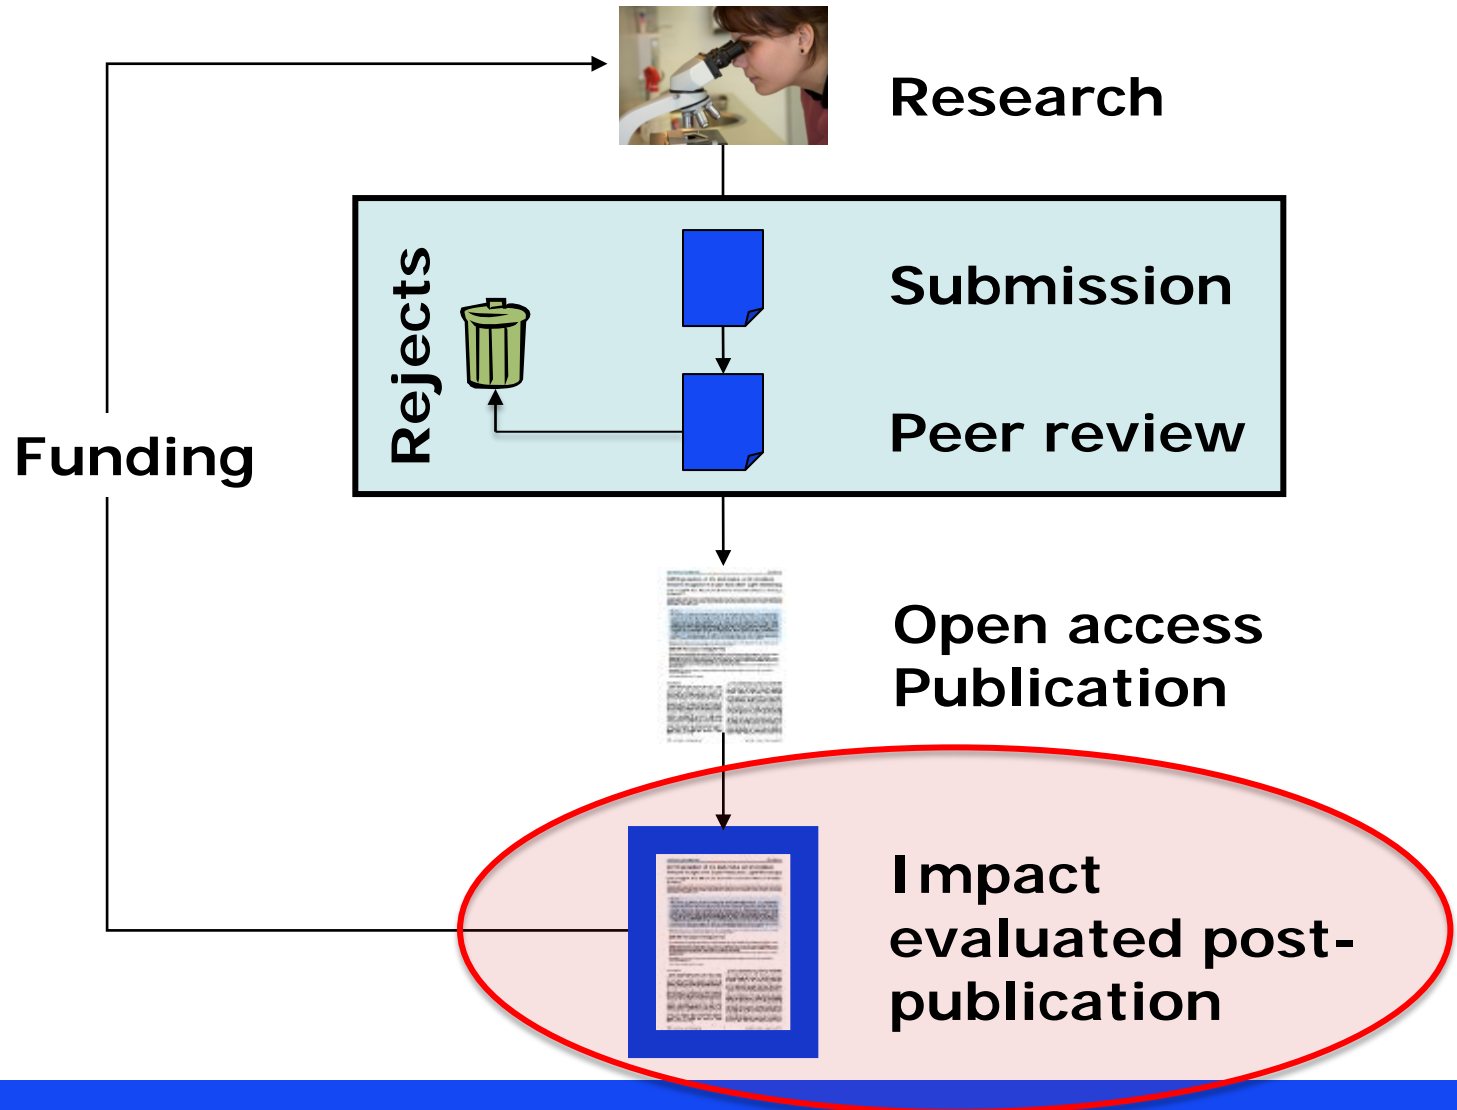

- When should 'scrutiny' happen?
- What does 'scrutiny' involve?

Most scientists regarded the new streamlined peer-review process as "quite an improvement."

A new way...

PLOS ONE's Key Innovation: the editorial process

- Editorial criteria
 - Scientifically rigorous
 - Ethical
 - Properly reported
 - Conclusions supported by the data
- Editors and reviewers **do not** ask
 - How important is the work?
 - Which is the relevant audience?
- Everything that deserves to be published, will be published
 - Therefore the journal is not artificially limited in size
- Use online tools to sort and filter scholarly content after publication, not before

Features of PLOS ONE

Covering all of Science (but mostly Biology and Medicine)

- Publishing daily
- Streamlined production (no copyediting, no author proofs)
- Full colour throughout (no extra charge)
- Papers of unlimited extent (no extra charge)
- Unlimited supplementary materials (no extra charge)
- Utilizes many Web 2.0 features (comments, notes, ratings)
- Utilizes many Web 2.0 tools (editorial board discussion forum; everyONE blog; Twitter; Facebook)
- Encouraging of debate and commenting
- Uses the most liberal 'CC BY' copyright license
- Operates an 'author pays' publication fee (\$1,350)

Publications by PLOS ONE per quarter since launch

The rise of the megajournals...

Collectively, these will represent...

“a very large compendium of papers that have been vetted for scientific quality, but which will not be confined in terms of their likely importance.”

Harold Varmus, Oct 2005

Collectively, these will represent...

*“a very large compendium of papers that have been vetted for scientific quality, but which **will not be confined in terms of their likely importance.**”*

Harold Varmus, Oct 2005

So how could we measure 'importance'?

At the **ARTICLE LEVEL**, we could track

- Citations
- Web usage
- Expert Ratings
- Social bookmarking
- Community rating
- Media/blog coverage
- Commenting activity
- and more...

Current technology now makes it possible to add these metrics automatically

Abstract [Top](#)

Background

One clade of Malagasy leaf chameleons, the *Brookesia minima* group, is known to contain species that rank among the smallest amniotes in the world. We report on a previously unrecognized radiation of these miniaturized lizards comprising four new species described herein.

Methodology/Principal Findings

The newly discovered species appear to be restricted to single, mostly karstic, localities in extreme northern Madagascar: *Brookesia confidens* sp. n. from Ankarana, *B. desperata* sp. n. from Forêt d'Ambre, *B. micra* sp. n. from the Islet Nosy Hara, and *B. tristis* sp. n. from Montagne des Français. Molecular phylogenetic analyses based on one mitochondrial and two nuclear genes of all nominal species in the *B. minima* group congruently support that the four new species, together with *B. tuberculata* from Montagne d'Ambre in northern Madagascar, form a strongly supported clade. This suggests that these species have diversified in geographical proximity in this small area. All species of the *B. minima* group, including the four newly described ones, are characterized by very deep genetic divergences of 18–32% in the *ND2* gene and >6% in the 16S rRNA gene. Despite superficial similarities among all species of this group, their status as separate evolutionary lineages is also

Pressure for Positive Results Puts Science Under Threat, Study Shows

ScienceDaily (Sep. 13, 2011) — Scientific research may be in decline across the globe because of growing pressures to report only positive results, new analysis suggests. A study by the University of Edinburgh examined more than 4,600 scientific research papers published between 1990 and 2007 and found a steady decline in studies in which the

positive ones, but they attract fewer readers and citations, so scientific journals tend to reject them.

It is acknowledged among scientists that this problem might be worsening, because competition in science is growing and jobs and grants are given to scientists who publish frequently in high-ranking journals. Many researchers, therefore, have speculated that scientists will increasingly pursue predictable outcomes and produce positive results through re-interpretation, selection or even manipulation of data.

The study examined research papers in which a hypothesis had been tested, in various scientific disciplines. Over the period studied, positive results were favored over

Abstract [Top](#)

Nine recently reported parapsychological experiments appear to support the existence of precognition. We describe three pre-registered independent attempts to exactly replicate one of these experiments, 'retroactive facilitation of recall', which examines whether performance on a memory test can be influenced by a post-test exercise. All three replication attempts failed to produce significant effects (combined $n = 150$; combined $p = .83$, one-tailed) and thus do not support the existence of psychic ability.

ESSAY

OPEN ACCESS

Why Most Published Research Findings Are False

[Article](#)

[Metrics](#)

[Related Content](#)

[Comments: 26](#)

John P. A. Ioannidis

Abstract [Top](#)

Summary

There is increasing concern that most current published research findings are false. The probability that a research claim is true may depend on study power and bias, the number of other studies on the same question, and, importantly, the ratio of true to no relationships among the relationships probed in each scientific field. In this framework, a research finding is less likely to be true when the studies conducted in a field are smaller; when effect sizes are smaller; when there is a greater number and lesser preselection of tested relationships; where there is greater flexibility in designs, definitions, outcomes, and analytical modes; when there is greater financial and other interest and prejudice; and when more teams are involved in a scientific field in chase of statistical significance. Simulations show that for most study designs and settings, it is more likely for a research claim to be false than true. Moreover, for many current scientific fields, claimed research findings may often be simply accurate measures of the prevailing bias. In this essay, I discuss the implications of these problems for the conduct and interpretation of research.

[SUBMIT YOUR STUDY →](#)

Overview

Many of the world's top media outlets, including [The New York Times](#) and [The Wall Street Journal](#), have reported on the issue of reproducibility in scientific research. Currently researchers lack easy avenues to validate and publish reproduced results.

...that's all about to change.

Science Exchange, PLOS and figshare, with the support of top academic journals, are launching the Reproducibility Initiative.

The Reproducibility Initiative is a new program to help scientists validate studies for publication or commercialization. Simply submit your study, and we'll match you to one of our 1000+ expert providers for validation. Validations are conducted blind, on a fee-for-service basis.

For scientists...

- Provide a venue for:
 - Negative results
 - Unfashionable results
 - Reproduction studies
- Manuscripts only need to be prepared and reviewed once
 - No more reformatting of references!
- Levels the playing field
 - Peer review is less likely to fall victim to the pot luck and bias associated with ‘tiered’ journals
 - Smaller fields are given the same visibility as large ones

For publishers

- Only need to index things once (Web of Science, PMC etc)
- Many aspects of the journal can be consolidated (marketing, Twitter stream etc)
- Economies of scale naturally develop, making the journal more efficient
- Innovations from third parties add value to your content
- Journal has the opportunity to set standards, which may become de facto standards in the field
- Sound research is not handed over to other publishers!

“the quality of submissions of ecological papers to *PLoS ONE* and the main ecological journals are probably comparable, that rejections by the main ecological journals to maintain a low acceptance rate are often arbitrary and independent of scientific merit, and that a large proportion of papers rejected by ecological journals are just as important for the scientific record and just as likely to be well cited as those that they do accept.”

Journal	Manuscript acceptance rate (%)	Impact factor (Web of Science)	Number of citations for ecological research papers	
			Mean	Median
<i>PLoS ONE</i>	69	4.4	11.6	8.0
<i>Ecology</i>	20	5.1	11.3	9.0
<i>Oikos</i>	15	3.4	7.8	6.5
<i>Functional Ecology</i>	15	4.6	10.7	9.0
<i>Ecology Letters</i>	<11	15.2	20.9	16.0
<i>Science</i>	<7	31.3	66.9	44.0
<i>Nature</i>	8	36.1	64.7	58.5

actively advertise their impact factor, and highlight that their selectivity means that they publish only the very best of the work that is submitted to them. As Aarssen (2012) notes, to maintain these low acceptance rates and “addiction to impact factor elitism...many editors routinely justify rejection of even high quality papers on the absurd claim of limited space...for printed pages

appropriate for a general ecological journal; this yielded 26 and 28 papers in *Nature* and *Science*, respectively. For each paper selected from each journal, I determined how many times it had been cited by using the Web of Science database in May 2012. The acceptance rate for all but one of the journals was obtained from the journal’s web page, recent editorials in the journal, or

Limitations

Limitations

- Harder to identify high impact papers at time of publication
 - ALTHOUGH new metrics are changing this
- Less choice for authors
 - Is this a problem?
- A “flood of low quality papers that wouldn’t have otherwise been published”

[en](#) Fish community structure in three temporarily open/closed estuaries on the Natal coast

T.D. Harrison and A.K. Whitfield

ABSTRACT

The fishes of three small Natal estuaries, the Mhlanga, Damba and Zotsha were sampled over a period of two years. A total of 68 fish taxa representing 24 families, 39 genera and 55 species were captured during this study. Forty seven fish taxa were recorded in the Mhlanga estuary of which *Gilchristella aestuaria*, *Oreochromis mossambicus*, *Valamugil cunnesius*, *Valamugil* sp. and juvenile mugilids numerically dominated. In terms of biomass, *O. mossambicus*, *V. cunnesius*, *Liza alata*, *Myxus capensis* and *Mugil cephalus* dominated the ichthyofauna of the Mhlanga system. In the Damba estuary, 24 fish taxa were recorded, the most abundant being *Glossogobius callidus*, *M. capensis* and *O. mossambicus*. *M. capensis*, *M. cephalus*, *O. mossambicus* and *G. callidus* dominated the fish biomass captured in the Damba system. A total of 56 fish taxa were recorded in the Zotsha estuary during this study, with the ichthyofauna numerically dominated by juvenile mugilids, *G. aestuaria*, *O. mossambicus*, *Rhabdosargus holubi*, *Terapon jarbua*, *Ambassis productus* and *G. callidus*. The species which dominated the fish biomass in the Zotsha system were *O. mossambicus*, *L. alata*, *Valamugil robustus*, *V. buchmanani*, *M. capensis*, *M. cephalus* and *V. cunnesius*.

Classifying the species according to whether they were resident estuarine, freshwater, estuarine-dependent marine or marine species revealed that the first three groups were all well represented in the systems. *Oreochromis mossambicus* was the dominant freshwater

PEER REVIEW HISTORY

BMJ Open publishes all reviews undertaken for accepted manuscripts. Reviewers are asked to complete a checklist review form ([see an example](#)) and are provided with free text boxes to elaborate on their assessment. These free text comments are reproduced below. Some articles will have been accepted based in part or entirely on reviews undertaken for other BMJ Group journals. These will be reproduced where possible.

ARTICLE DETAILS

TITLE (PROVISIONAL)	Geographical variation in blindness and sight impairment rates in England, 2008-09: Analysis of national certification data
AUTHORS	Malik, Aesha; Bunce, Catey; Wormald, Richard; Suleman, Mehrunisha; Stratton, Irene; Gray, Muir

VERSION 1 - REVIEW

REVIEWER	Jennifer Evans Lecturer London School of Hygiene and Tropical Medicine I have worked with some of the authors of this paper, in particular Richard Wormald and Catey Bunce, over many years.
REVIEW RETURNED	06-Jul-2012

THE STUDY	Under limitations, I felt that the question of standardisation and control of confounding by age might be one limitation of the analysis. The authors have controlled for age differences between PCTs using direct standardisation. They acknowledge one of the limitations of direct standardisation is that, if the number of events in each age band is low, then it can be subject to sampling error. As a result they have used rather wide age-bands. There may be residual confounding by age, particularly in the older age-groups. This might explain some of the variation. One option would be to repeat the

Impact of evergreening on patients and health insurance: a meta analysis and reimbursement cost analysis of citalopram/escitalopram antidepressants

Ali A Alkhafaji, Ludovic Trinquart, Gabriel Baron, Moise Desvarieux and Philippe Ravaud
BMC Medicine 2012, **10**:142 doi:10.1186/1741-7015-10-142

In the meta-analysis of seven head-to-head trials (2,174 patients), efficacy was significantly better for escitalopram than citalopram (combined odds ratio (OR) 1.60 (95% confidence interval 1.05 to 2.46)). However, for the adjusted indirect comparison of 10 citalopram and 12 escitalopram placebo-controlled trials, 2,984 and 3,777 patients respectively, efficacy was similar for the two drug forms (combined indirect OR 1.03 (0.82 to 1.30)). Because of the discrepancy, we could not combine direct and indirect data (test of inconsistency, $P = 0.07$). A similar discrepancy was found for treatment acceptability. The overall reimbursement cost burden for the citalopram, escitalopram and its generic forms was 120.6 million Euros in 2010, with 96.8

The nuclear pore complex (NPC) consists of a conserved set of ~30 different proteins, termed nucleoporins, and serves as a gateway for the exchange of materials between the cytoplasm and nucleus. Tpr (translocated promoter region) is a component of NPC that presumably localizes at intranuclear filaments. Here, we show that Tpr knockdown caused a severe reduction in the number of nuclear pores. Furthermore, our electron microscopy studies indicated a significant reduction in the number of inner nuclear filaments. In addition, Tpr siRNA treatment impaired cell growth and proliferation compared to control siRNA-treated cells. In Tpr-depleted cells, the levels of p53 and p21 proteins were enhanced. Surprisingly, Tpr depletion increased p53 nuclear accumulation

Questions

- When a journal represents 2%, 5%, 50% of the literature, is it even a journal any more?
- How will megajournals differentiate themselves?
- How will the publishing landscape be transformed?

Damian Pattinson

dpattinson@plos.org
@damianpattinson

Why has PLOS ONE worked?

- Speed
 - Turnaround times not hugely fast, but publication criteria mean you can get your research out quicker
- Reputation
 - Non-profit
 - Started by scientists for scientists
 - Other journals built reputation of PLOS before launch of ONE
- Visibility
 - Regular appearance in most major news outlets
 - Innovative approach got people talking
