Project Open Source Academic Publishing Suite (OS-APS)

Simple, media-neutral publishing with
automatic corporate design

Problem: Break in the publication workflow

Solution: XML-first Workflow for media-neutral publishing in Open Access

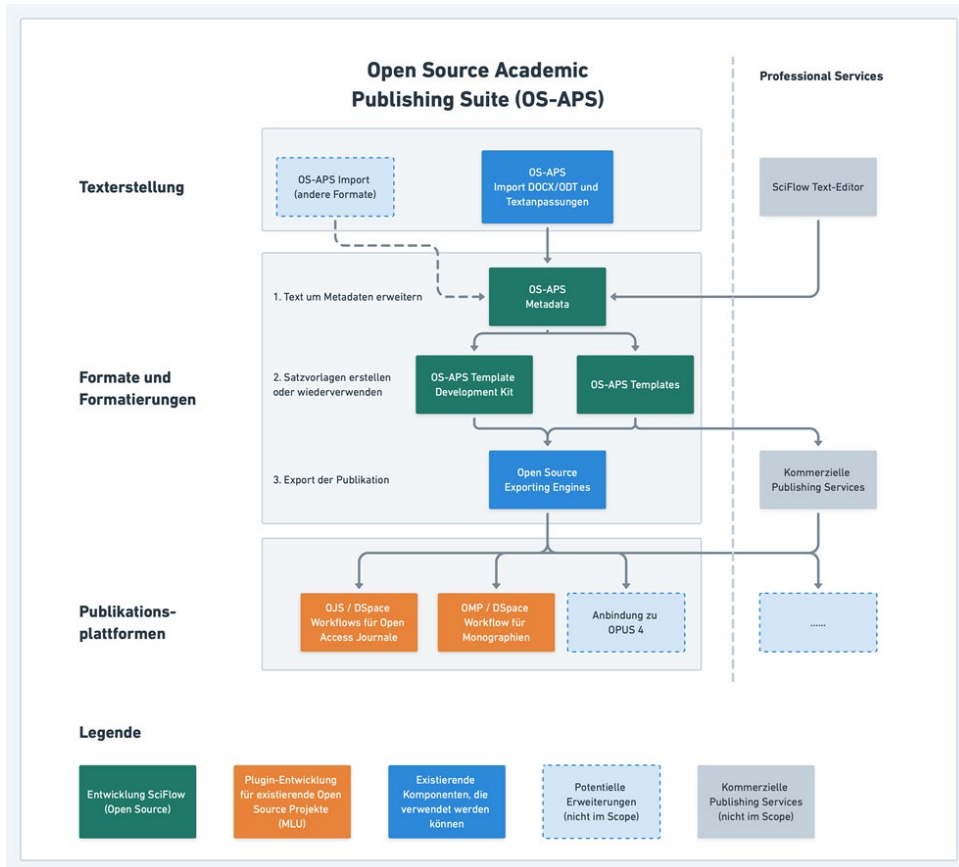

- Lean single-source publishing workflow based on XML
- Out-of-the box cloud solution for smaller publishers to generate formats and formatting
- Open Source development
 - Re-use of existing Open Source components
 - The software itself will be made available as Open Source
- Conception as “software as a service”
 - Hosting
 - On-premise (Docker)

Single-source publishing for small and medium-sized (university) publishers

Success criteria:

- Acceptance in the target group of researchers
- Easy introduction
- Integration into the publication workflow with Open Journal Systems (OJS) / Open Monograph Press (OMP)
- Re-use and expansion

OS-APS components

- **Import:** Manuscript formats such as Word or Open Document are imported and transformed into a semantic HTML format (Open Source)
- **Editor:** Further semantic information can be added to the imported text as needed through an easy-to-use user interface.
- **Design:** Predefined templates or custom-made templates that can be created using the Template Development Kit
- **Export:** Export of various formats (PDF, EPUB, HTML, XML)

Interfaces

- Open Journal Systems (OJS)
- Open Monograph Press (OMP)
- Open Access Repositories (DSpace)
- SciFlow collaborative text editor
- Others, if prioritized and possible in the course of the project: [Official website of OS-APS](#)

One workflow at a time

We form "patterns" of workflow, which we then gradually support
